TRITON

Izar thermostatic mixer shower

Installation and operating instructions

INSTALLERS PLEASE NOTE THESE INSTRUCTIONS ARE TO BE LEFT WITH THE USER

2180439A March 2005

CONTENTS

To check the product suitability for commercial and multiple installations, please contact Triton's specification advisory service before installation.

Telephone: 024 7632 5491

Facsimile: 024 7632 4564

E mail: technical@tritonshowers.co.uk

INTRODUCTION

This book contains all the necessary fitting and operating instructions for your Triton Izar bar mixer thermostatic shower.

Please read the instructions carefully. Read through the whole of this book before beginning your installation.

The shower installation MUST be carried out by a suitably competent person and in sequence of this instruction book.

Care taken during the installation will provide a long and trouble free life from your shower.

For the best performance within the specified running pressure range a minimum flow of eight litres per minute should be available to both inlets.

The mixer shower MUST NOT be subjected to water temperatures above 80°C.

This mixer is designed for use with traditional low pressure 'gravity' water systems, using a cold water cistern and hot water cylinder. It is also suitable for the higher pressure systems found in the UK up to a maximum of 3 bar running pressure.

IMPORTANT: When installing the mixer with a combination boiler or multi-point, flow restricters MUST be installed in the unit.

The mixer is suitable for fully modulating type combination boilers and multi-point hot water heaters. It is also suitable for thermal storage, unvented systems and pumped gravity systems.

IMPORTANT: Before installing with a gas instantaneous water heater, make sure it is capable of delivering hot water at a minimum switch-on flow rate of 3 litres per minute. At flow rates between 3 and 8 litres per minute, the appliance must be capable of raising the water temperature to a minimum of 52°C. Water temperature at the inlet to the mixer must remain relatively constant when flow rate adjustments are made *(refer to the water heater operating manual to confirm compatibility with this mixer shower)*.

These mixers are supplied with an integral single check valve and integral filter in each inlet. Inlet connections are to 15mm compression or ½" BSP female fittings (not supplied).

SAFETY WARNINGS

a Layout and sizing of pipework must be such that when other services are used, pressures at the shower control inlets do not fall below the recommended minimum.

b DO NOT choose a position where the shower could become frozen.

c DO NOT connect this mixer shower to any form of tap or fitting not recommended by the manufacturer.

d The sprayhead MUST be regularly cleaned to remove scale and debris.

e Conveniently situated service valves in each inlet supply MUST be fitted as an independent method of isolating the shower should maintenance or servicing be necessary.

f If it is intended to operate the shower in areas of hard water (above 200 ppm temporary hardness), a scale inhibitor may have to be fitted. For advice on the Triton scale inhibitor, please contact Customer Service.

g DO NOT operate the shower outside the guidelines as laid out in *'site requirements'.*

Replacement parts can be ordered from Triton Customer Service. See *'spare parts'* for details and part numbers.

Due to continuous improvement and updating, specification may be altered without prior notice.

COMPONENTS

Fig.1

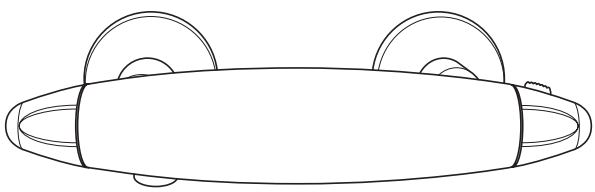

Fig.2

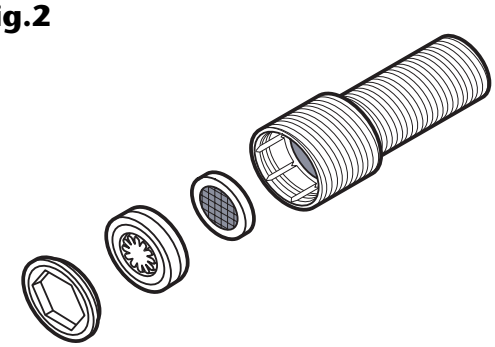

1 Izar thermostatic mixer valve **(fig.1)**

2 Sprayhead *(not shown)*

3 Riser rail kit *(not shown)*

4 Flexible hose *(not shown)*

5 Straight connector **(fig.2)**

SITE REQUIREMENTS

The installation must be in accordance with Water Regulations and Byelaws.

Running water pressure:

0.1 bar to 3.0 bar max.

Maximum static water pressure:

7 bar

DO NOT connect the mixer shower to a gravity hot supply and a mains cold supply (or vice versa).

For the best performance within the specified running pressure range a minimum flow of eight litres per minute should be available at nominally equal pressures to both inlets.

While the mixer shower is operational (open outlet), inlet pressures must not be capable of exceeding 7 bar. For effective operation of the internal seals, the maximum static pressure must not be exceeded.

Note: On sites where the running pressure is above 3 bar, the use of a suitably sized pressure reducing valve fitted in the cold mains supply pipework can provide nominally equal pressures at the mixer shower.

The pipework should be installed such that the flow is not significantly affected by other taps and appliances being operated elsewhere on the premises.

Where thermal store systems and instantaneous gas water heaters are used, if excessive draw offs take place the boiler may not be able to maintain an adequate output temperature. This could result in the shower temperature becoming noticeably cooler.

Water temperature requirements

Maximum hot water temperature = 80°C

Recommended maximum = 65°C

Minimum hot water temperature = 52°C

Maximum cold water temperature = 20°C

BS 6700 recommends that the temperature of stored water should never exceed 65°C.

A stored water temperature of 60°C is considered high enough to meet all normal requirements and will minimise the effects of scale in hard water areas.

Temperature adjustment range

The mixed water temperature can be adjusted from cold through to a top limit which can be preset during installation with full anti-scald protection throughout the range (35°C to 40°C), providing the hot water temperature at the inlet remains 10°C above the outlet temperature.

Should there be a loss of flow to either incoming supply then water from the shower will stop or be reduced to a trickle until both supplies return.

Fig.3 (*diagrammatic view – not to scale)*

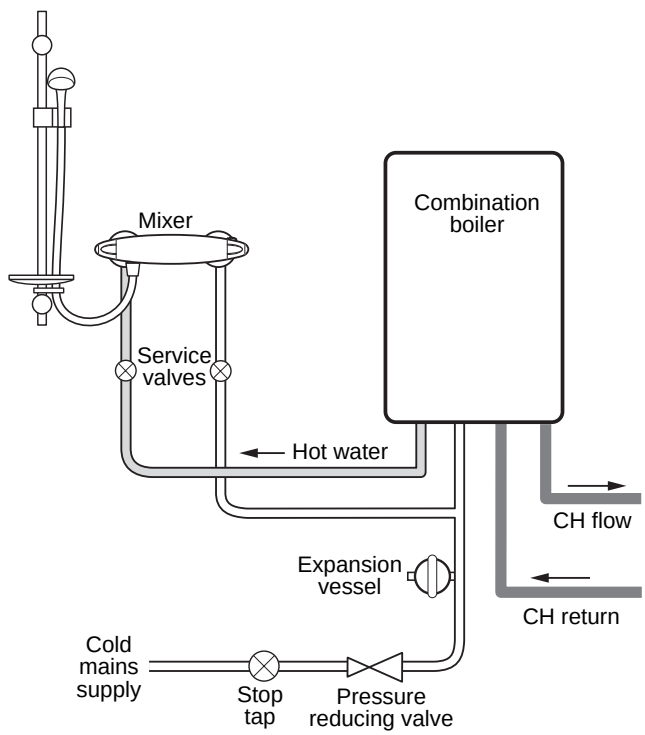

Fig.4 (*diagrammatic view – not to scale)*

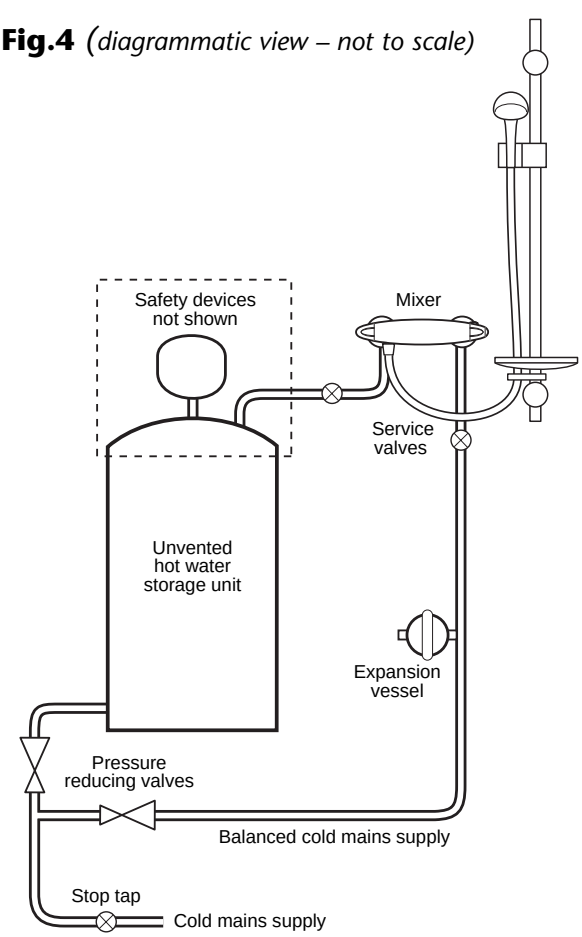

TYPICAL SUITABLE INSTALLATIONS

a) Instantaneous gas-heated systems, e.g. combination boilers (fig.3)

The shower control MUST be installed with a multipoint gas water heater or combination boiler of a fully modulating design (i.e. to maintain relatively stable hot water temperatures).

A drop tight pressure reducing valve MUST be fitted if the supply pressures exceed 5 bar running.

An expansion vessel (shown in **fig.3**) MUST be fitted, and regularly maintained, to make sure the shower mixer is not damaged by excess pressures. This may already be installed within the boiler (check with manufacturer) and is in addition to the normally larger central heating expansion vessel.

The layout and sizing of pipework MUST be such that nominally equal inlet supply pressures are achieved and the effects of other draw-offs are minimised. The hot supply temperature MUST remain a minimum of 10°C hotter than the required blend temperature for optimum performance.

b) Unvented mains pressure systems (fig.4)

The shower control can be installed with an unvented, stored hot water cylinder.

For systems with no cold water take off after the appliance reducing valve, it will be necessary to fit an additional drop tight pressure reducing valve when the mains pressure is over 3 bar. The drop tight pressure reducing valve must be set at the same value as the unvented package pressure reducing valve.

Note: An additional expansion vessel **(fig.4)** may be required if a second pressure reducing valve is installed. This does not apply to packages with a cold take off after the pressure reducing valve to the cylinder.

The layout and sizing of pipework MUST be such that nominally equal inlet supply pressures are achieved and the effects of other draw-offs are minimised.

c) Mains pressurised thermal store systems (fig.5)

Packages of this type, fitted with a tempering valve (blender valve) can be used. A drop tight pressure reducing valve MUST be fitted if the supply pressures exceed 3 bar running.

An expansion vessel (shown in **fig.5**) MUST be fitted, and regularly maintained, to make sure the unit is not damaged by excess pressures. This may already be installed externally or internally within the thermal store (check with thermal store manufacturer).

d) Gravity fed systems (fig.6)

The shower control MUST be fed from a cold water cistern and hot water cylinder providing nominally equal pressures. There must be a minimum head of water of 1 metre. The minimum head distance is measured from the base of the cold water cistern to top of the sprayhead.

e) Pump assisted gravity fed systems (fig.7)

The pump MUST be fed from a cold water cistern and hot water cylinder providing nominally equal pressures. The pump must be capable of maintaining a minimum running pressure of 1 bar.

Fig.5 (*diagrammatic view – not to scale)*

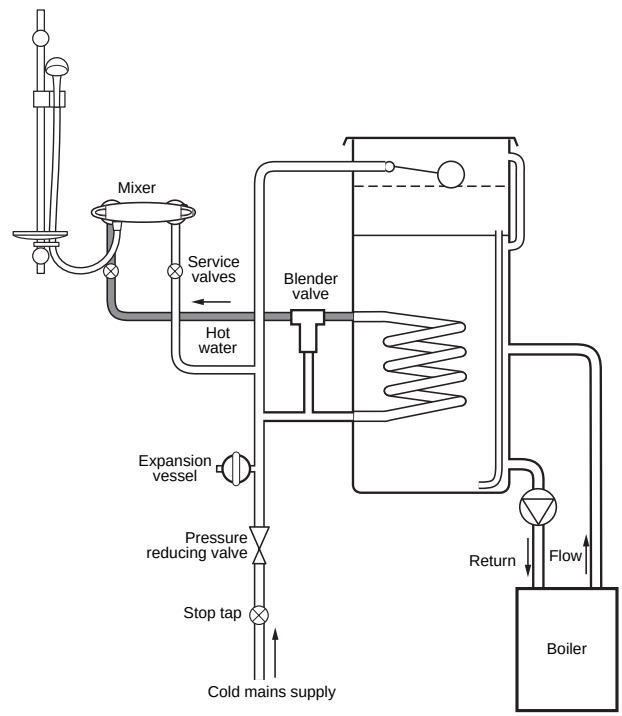

Fig.6 (*diagrammatic view – not to scale)*

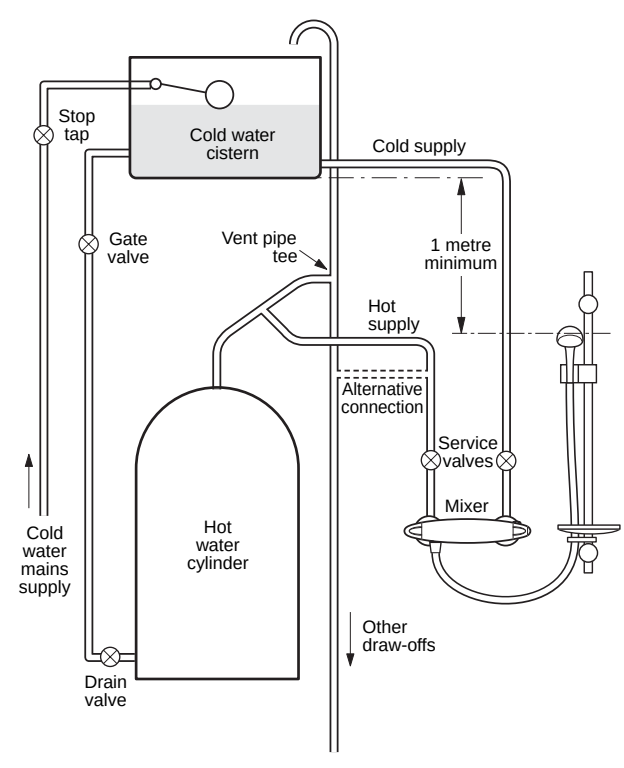

Fig.7 (*diagrammatic view – not to scale)*

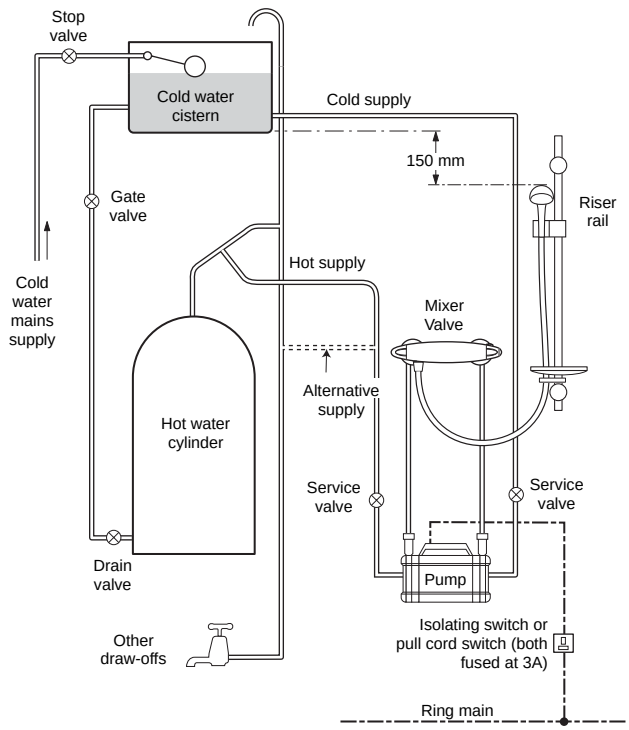

Fig.8

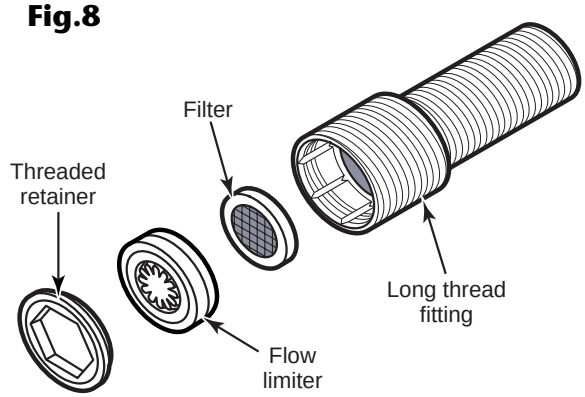

INSTANTANEOUS WATER HEATERS APPLIANCE CAPABILITIES

To obtain the best performance from the shower when connected to an instantaneous water heater, the appliance must be capable of raising the temperature of the incoming water to a minimum of 52°C (125°F) and delivering a flow rate of not less than eight litres per minute.

Flow limiters are supplied for controlling the maximum flow. To fit the flow limiter, insert it into the long thread inlet fitting and secure in place using the threaded retainer **(fig.8)**.

With the flow limiters fitted and when the system is in use, the On/Off flow control should be turned fully anti-clockwise to full flow setting.

PREPARING THE MIXER VALVE

WARNING!

The shower must not be positioned where it will be subjected to freezing conditions.

Check the contents to make sure all parts are present.

Before installing, make sure all the openings on the valve are carefully covered to stop the ingress of any debris, etc. while routing the supply pipework.

The shower valve is suitable for installation on a solid wall, a stud partition wall, dry lined wall or fixing to a laminate cubicle or panel.

The hot and cold water pipes should be securely attached within the wall or panel to support the valve and prevent movement after installation.

The hot water inlet has a red symbol next to the inlet and must be on the left-hand side.

SITING OF THE SHOWER

Refer to **fig.9** for correct siting of the shower.

Position the shower and sprayhead on the wall so that all controls can be comfortably reached while using the shower. The sprayhead can be positioned either side of the shower.

The unit must be positioned horizontally with the outlet port at the bottom.

INSTALLATION

Note: The outlet of the shower must not be connected to anything other than the sprayhead supplied.

DO NOT use jointing compounds on any pipe fittings for the installation.

DO NOT solder fittings near the mixer unit as heat can transfer along pipework and damage the seals and thermostatic components.

Note: Suitable service valves (complying with Water Regulations and Byelaws) MUST be fitted on the hot and cold water supplies to the shower as an independent means of isolating the water supplies should maintenance or servicing be necessary.

When connecting the pipework, avoid using tight 90° elbows. Swept or formed bends will give the best performance.

The supply pipes can be routed either from the side, rising, rear or falling and must finish in suitable fittings (not supplied) to accept the straight coupler **(fig.10)**.

The straight connectors can be used to connect to ½" BSP female elbow fittings in solid wall installations. The terminating outlet elbows must be aligned horizontally and centred to 150mm.

The hot and cold supply pipes must be anchored rigidly in order to support the valve and prevent movement after installation.

If installing in hollow walls or laminate cubicles, the fittings are supplied to compress onto the wall to support the shower valve **(fig.11)**.

IMPORTANT: Using a suitable sealant, always seal around the incoming pipework to prevent water entering the wall.

Fig.9 *(diagrammatic view – not to scale)*

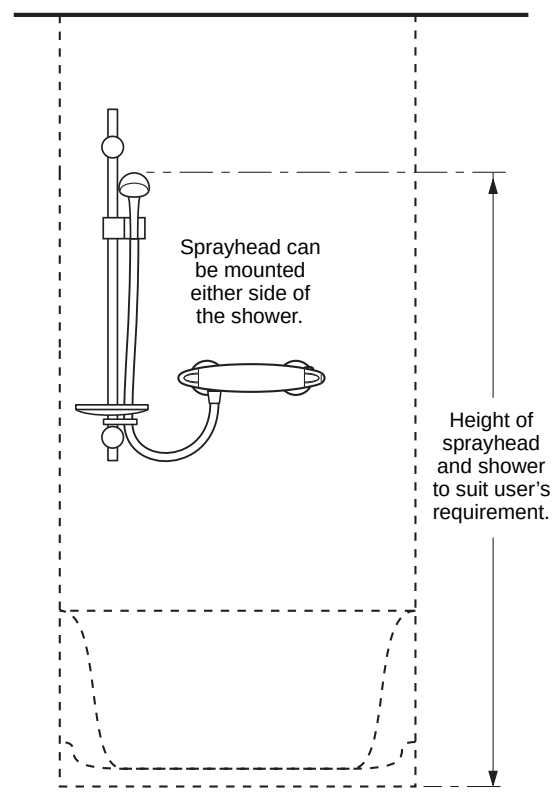

Fig.10

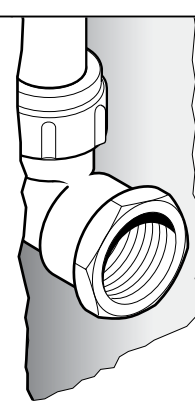

Fig.11

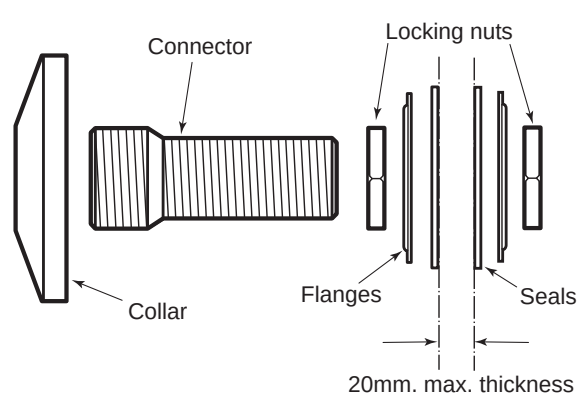

Fig.12

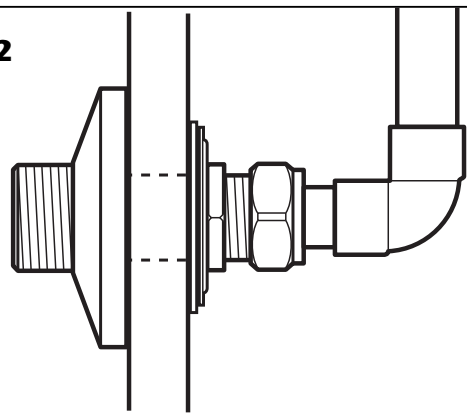

Fig.13

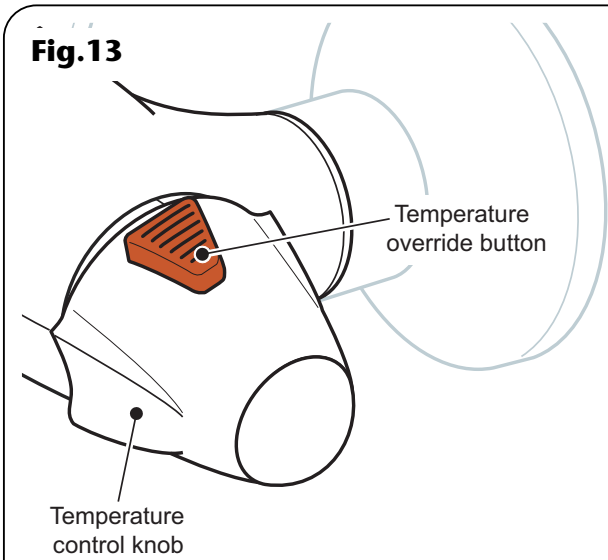
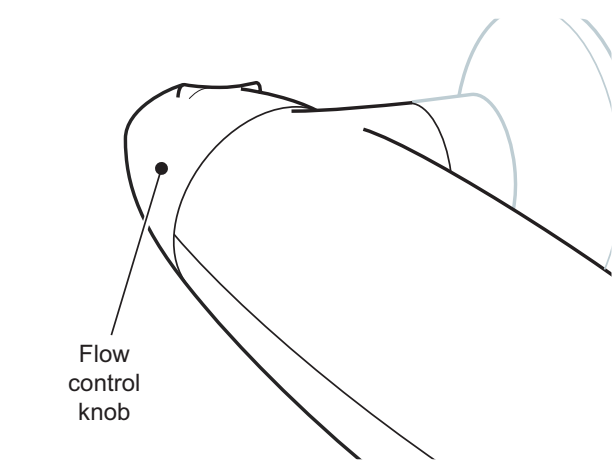




The maximum thickness of wall is about 20mm. Enough room must be left on the fitting to accommodate the compression nut and olive. At the front end, allowance must be made to accept the shower union and collar.

Flush out the pipework in accordance with Water Regulations and Byelaws.

Connect 15mm pipes using standard compression nuts and olives **(fig.12)**.

Screw the supplied collars onto the fittings until tight to the wall.

Offer the shower valve to the fittings and, making sure the sealing washers are in place, screw the unions onto the fittings. If installing with a combi-multipoint system make sure the flow limiters are fitted.

LEAK TESTING

Fit the hose to the outlet and direct it to waste. Open the supplies and test for leaks in the valve connections. Remedy any leaks if necessary.

COMMISSIONING

Make sure that both the hot and cold water supplies are fully open and at (or near to) their design temperature and pressures and are within the requirements as stated.

Check the temperature knob (right-hand side) is rotated fully anti-clockwise (press the override button to achieve maximum temperature setting).

Make sure the sprayhead is directed to waste.

Start the water flow by turning the flow control (left-hand side) anti-clockwise.

Allow the shower to run at the maximum temperature setting until the water temperature has stabilised. Rotate the temperature control knob until your desired maximum showering temperature is reached.

The mixer is fitted with a maximum temperature override button factory set at 38°C.

The mixer valve is factory set to give a maximum outlet temperature of 38°C. This should be checked on site to make sure the setting has not been altered and also to ensure user safety.

OPERATING THE SHOWER

The controls for the mixer shower are shown in **Fig.13**.

To start the shower, rotate the On/Off flow control (left-hand side) fully anti-clockwise for maximum flow.

To stop the water flow, rotate the On/Off flow control fully clockwise.

To adjust the water temperature, rotate the temperature control (right-hand side) – clockwise for a cooler shower or anti-clockwise for a hotter shower.

To overcome the maximum temperature stop, depress the red temperature override button.

CAUTION: Exposed metal surfaces may become hot during use.

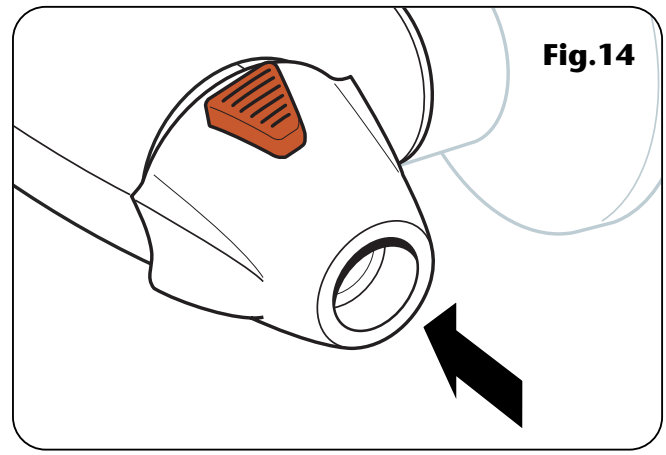
Adjusting the maximum temperature override setting

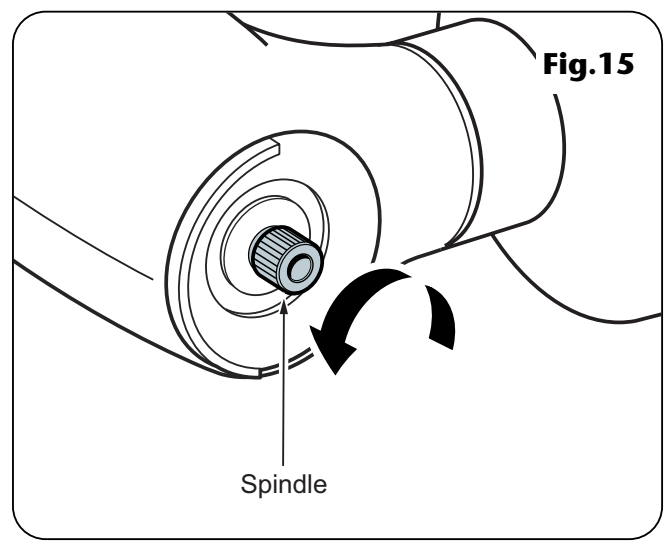
Remove the end cap to expose the retaining screw **(fig.14)**. With a suitable screwdriver, undo the screw and pull off the temperature control.

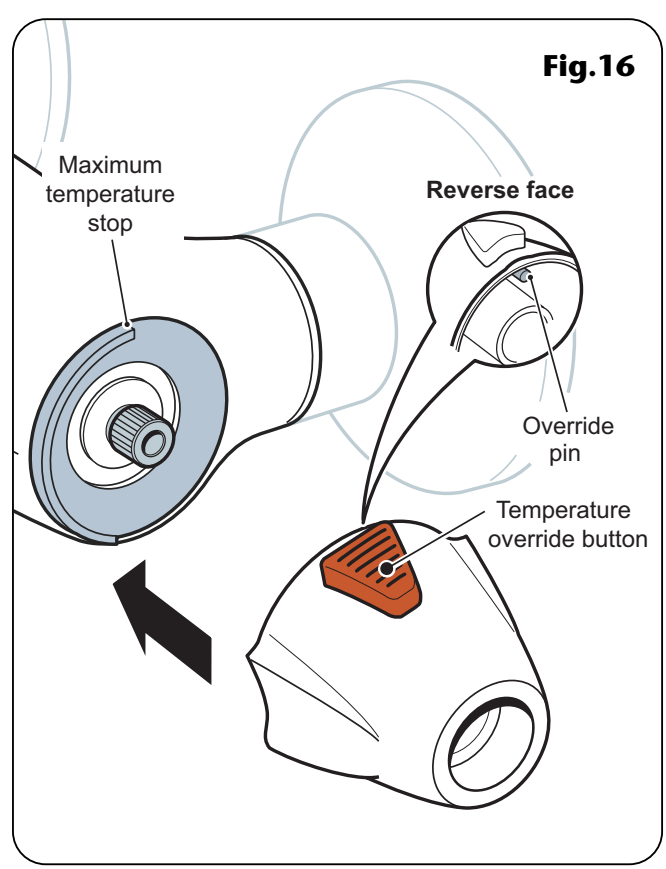
Turn the flow control (left-hand control) clockwise and allow the shower to run until the water temperature has stabilised.

Carefully turn the temperature spindle anti-clockwise to increase the maximum outlet temperature **(fig.15)**. Once you are satisfied with the showering temperature refit the temperature control. Take care to align the override pin in the control knob with the top of the maximum temperature stop **(fig.16)**.

Secure the temperature control in place with the retaining screw and refit the end cap.







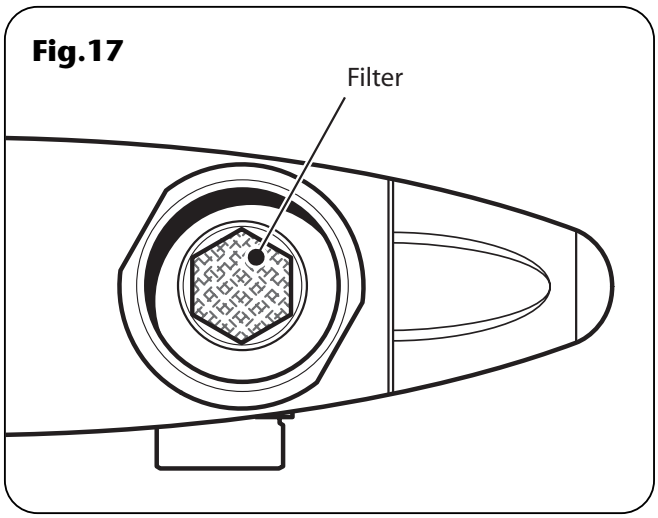


Fig.17

CLEANING

DO NOT use abrasive or solvent cleaning fluids. The shower unit should be cleaned using a soft cloth and warm water.

CLEANING THE FILTERS

Turn off the water supplies before starting.

To access the filters will require the removal of the unit from the inlet fittings.

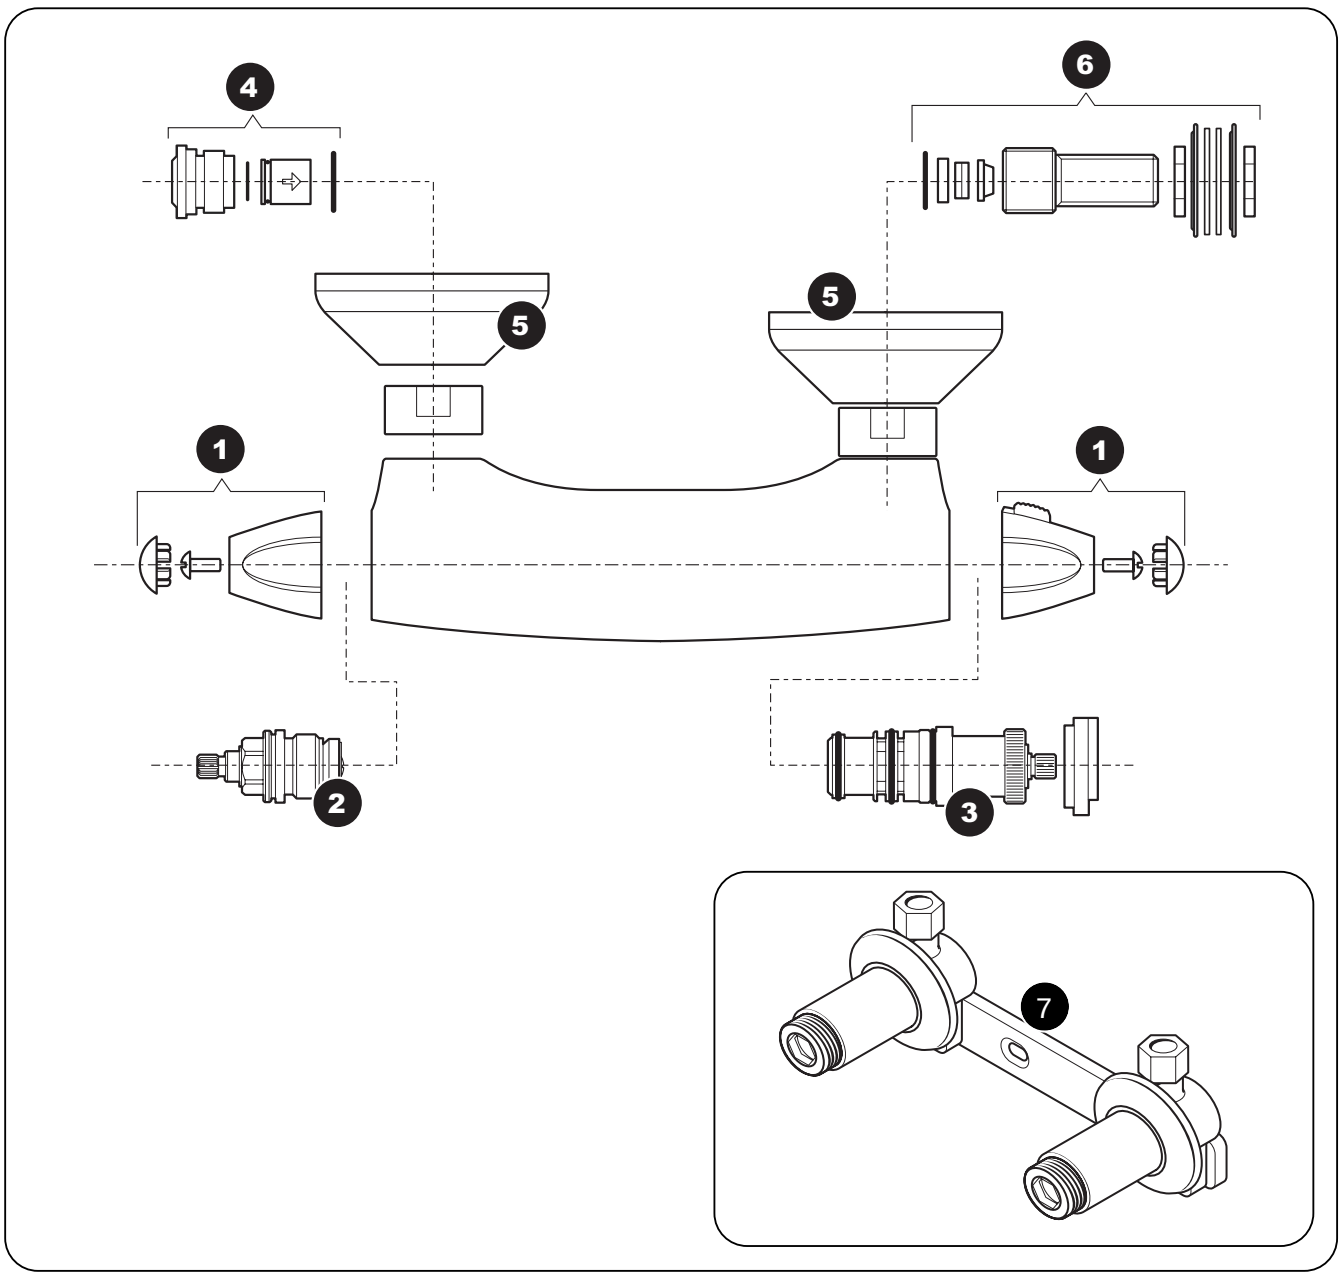
Remove the sealing washers from the union inlets. Unscrew the filter cap on each inlet **(fig.17)** and remove the filter.

Wash the filter thoroughly under running water to remove all debris.

Replace the filter and secure in place with the filter cap. Refit the sealing washers back into each inlet union.

Reassemble the shower to the inlet fittings.

SPARE PARTS



Ref.	Description	Part No.	Ref.	Description	Part No.
1	Closure knob & flow knob	83308630	**5**	Trim pack	86001150
2	Mechanic headwork	83308640	**6**	Connector and trim pack	UNPIPCON
3	Thermostatic cartridge	83308650	**7**	Bar bracket (optional)	UNBMXBKT
4	Non-return valve	83308660			

FAULT FINDING

The following can be carried out by a competent person

Problem/Symptom	*Cause*	*Action/Cure*
1 Water too hot.	**1.1** Temperature control incorrectly commissioned.	**1.1.1** Refer to *'commissioning'* section.
	1.2 Not enough cold water flowing through shower.	**1.2.1** Turn temperature control anti-clockwise.
	1.3 Increase in the ambient cold water temperature.	**1.3.1** Turn temperature control anti-clockwise.
	1.4 Cold water supply blocked.	**1.4.1** Turn off shower and consult a competent plumber or contact Triton Customer Service.
	1.5 High volume of cold water drawn off elsewhere.	**1.5.1** Reduce the simultaneous demand from the supply.
2 Water too cold.	**2.1** Temperature control incorrectly commissioned.	**2.1.1** Refer to *'commissioning'* section.
	2.2 Not enough hot water flowing through shower.	**2.2.1** Turn the temperature control clockwise.
	2.3 Decrease in the ambient cold water temperature.	**2.3.1** Turn the temperature control clockwise.
	2.4 Insufficient hot water supplies from the heating system.	**2.4.1** Make sure heating appliance is set to maximum or has enough stored hot water. **2.4.2** Make sure heating appliance is igniting by trying a hot water tap elsewhere.
	2.5 Hot water supply blocked or restricted.	**2.5.1** Turn off shower and consult a competent plumber or contact Triton Customer Service.
	2.6 Flow limiter not fitted (HP systems only).	**2.6.1** Fit flow limiters in the inlets; see *'instantaneous water heater appliance capabilities'*.
3 High water flow and/or poor performance on a mains fed system.	**3.1** Flow limiters not fitted.	**3.1.1** Fit flow limiters in the inlets; see *'instantaneous water heater appliance capabilities'*.
4 Water does not flow or shower pattern collapses when another outlet is turned on.	**4.1** Water supplies cut off.	**4.1.1** Check water elsewhere in house and if necessary contact local water company.
	4.2 Shower unit blocked.	**4.2.1** Inspect the inlet filters. Clean if necessary.
	4.3 Blockage in pipework.	**4.3.1** Turn off the shower and consult a suitably competent plumber.
	4.4 Sprayhead blocked.	**4.4.1** Clean the sprayhead.
	4.5 System not capable of supplying multiple outlets at the same time.	**4.5.1** Reduce the simultaneous demand. **4.5.2** Check stop/service valves are fully open. **4.5.3** Check if enough water pressure.

FAULT FINDING

The following is recommended for a professional qualified installer only

Problem/Symptom	*Cause*	*Action/Cure*
5 Water too cold.	**5.1** Running pressure in excess of maximum recommended.	**5.1.1** Fit a pressure reducing valve.
6 Shower controls noisy while in use.	**6.1** Running pressure in excess of maximum recommended.	**6.1.1** Fit a pressure reducing valve.
7 Shower will not shut off.	**7.1** Flow control washer worn.	**7.1.1** Renew flow control washer.

Service Policy

In the event of a complaint occurring, the following procedure should be followed:

1 Telephone Customer Service on 024 7637 2222 (0845 762 6591 in Scotland and in Northern Ireland), having available the model number and power rating of the product, together with the date of purchase.

2 Triton Customer Service will be able to confirm whether the fault can be rectified by either the provision of a replacement part or a site visit from a qualified Triton service engineer.

3 If a service call is required it will be booked and the date of call confirmed. In order to expedite your request, please have your postcode available when booking a service call.

4 It is essential that you or an appointed representative (who must be a person of 18 years of age or more) is present during the service engineer's visit and receipt of purchase is shown.

5 A charge will be made in the event of an aborted service call by you but not by us, or where a call under the terms of guarantee has been booked and the failure is not product related (i.e. scaling and furring, incorrect water pressure, pressure relief device operation, electrical installation faults).

6 If the product is no longer covered by the guarantee, a charge will be made for the site visit and for any parts supplied.

7 Service charges are based on the account being settled when work is complete, the engineer will then request payment for the invoice. If this is not made to the service engineer or settled within ten working days, an administration charge will be added.

Replacement Parts Policy

Availability: It is the policy of Triton to maintain availability of parts for the current range of products for supply after the guarantee has expired. Stocks of spare parts will be maintained for the duration of the product's manufacture and for a period of five years thereafter.

In the event of a spare part not being available a substitute part will be supplied.

Payment: The following payment methods can be used to obtain spare parts:

1 By post, pre-payment of pro forma invoice by cheque or money order.

2 By telephone, quoting credit card (MasterCard or Visa) details.

3 By website order, www.tritonshowers.co.uk

Triton Plc
Shepperton Park
Caldwell Road
Nuneaton
Warwickshire CV11 4NR

TRITON STANDARD GUARANTEE

Triton Plc guarantee this product against all mechanical defects arising from faulty workmanship or materials for a period of one year for domestic use only, from the date of purchase, provided that it has been installed by a competent person in full accordance with the fitting instructions.

Any part found to be defective during this guarantee period we undertake to repair or replace at our option without charge so long as it has been properly maintained and operated in accordance with the operating instructions, and has not been subject to misuse or damage.

This product must not be taken apart, modified or repaired except by a person authorised by Triton Plc. This guarantee applies only to products installed within the United Kingdom and does not apply to products used commercially. This guarantee does not affect your statutory rights.

What is not covered:

1 Breakdown due to: ***a)*** use other than domestic use by you or your resident family; ***b)*** wilful act or neglect; ***c)*** any malfunction resulting from the incorrect use or quality of water or incorrect setting of controls; ***d)*** faulty installation.

2 Repair costs for damage caused by foreign objects or substances.

3 Total loss of the product due to non-availability of parts.

4 Compensation for loss of use of the product or consequential loss of any kind.

5 Call out charges where no fault has been found with the appliance.

6 The cost of repair or replacement of pressure relief devices, sprayheads, hoses, riser rails and/or wall bracket or any other accessories installed at the same time.

7 The cost of routine maintenance, adjustments, overhaul modifications or loss or damage arising therefrom, including the cost of repairing damage, breakdown, malfunction caused by corrosion, furring, pipe scaling, limescale, system debris or frost.
