INTRODUCTION

This book contains all the necessary fitting and operating instructions for your Triton Mimosa dual control thermostatic mixer shower. Please read them carefully. Read through the whole of this book BEFORE beginning your installation.

The shower installation MUST be carried out by a suitably competent person and in sequence of this instruction book.

Care taken during the installation will provide a long and trouble free life from your shower.

For best performance within the specified running pressure range a minimum flow of eight litres per minute should be available to both inlets.

The mixer shower MUST NOT be subjected to water temperatures above 80°C.

This mixer shower is designed for use with traditional low pressure 'gravity' water systems, using a cold water cistern and hot water cylinder as well as for the higher pressure systems found in the UK up to a maximum of 5 bar running pressure.

IMPORTANT: When installing this mixer with combination and multipoint hot water appliances, flow regulators may be installed in the inlet pipework if required.

This mixer shower is suitable for fully modulating type combination boilers and multipoint hot water heaters. It is also suitable for thermal storage, unvented systems and pumped gravity systems.

IMPORTANT: Before installing with a gas instantaneous water heater, make sure it is capable of delivering hot water at a minimum switch-on flow rate of 3 litres per minute. At flow rates between 3 and 8 litres per minute, the appliance must be capable of raising the water temperature to a minimum of 52°C.

Water temperature at the inlet to the mixer must remain relatively constant when flow rate adjustments are made (*refer to the water heater operating manual to confirm compatibility with this mixer shower*).

This mixer shower is supplied with an integral single check valve and integral large area filter in each inlet. Inlet connections are by ½" BSP to 22 mm or 15 mm compression (not supplied).

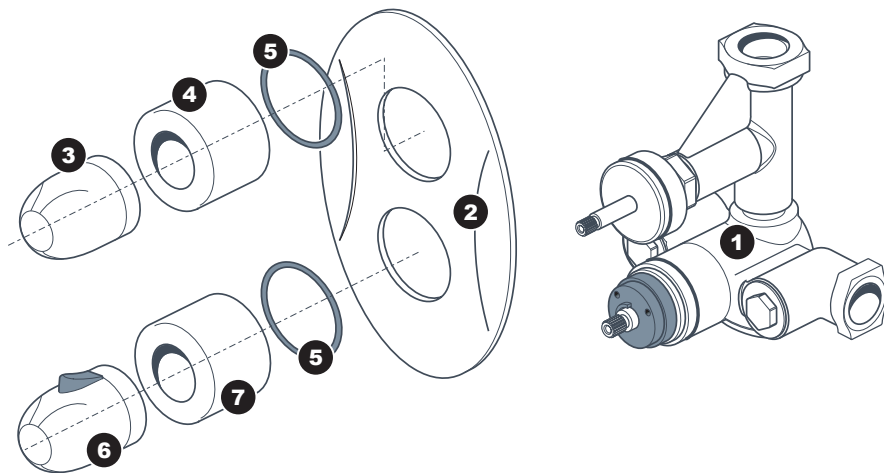

SAFETY WARNINGS

- a. Layout and sizing of pipework MUST be such that when other services are used pressures at the shower control inlets do not fall below the recommended minimum.
- b. DO NOT choose a position where the shower could become frozen.
- c. DO NOT connect this mixer shower to any form of tap or fitting not recommended by the manufacturer.
- d. The showerhead MUST be regularly cleaned to remove scale and debris.
- e. Conveniently situated service valves in each inlet supply MUST be fitted as an independent method of isolating the shower should maintenance or servicing be necessary.
- f. If it is intended to operate the shower in areas of hard water (above 200 ppm temporary hardness), a scale inhibitor may have to be fitted. For advice on the Triton scale inhibitor, please contact Customer Service.
- g. DO NOT operate the shower outside the guidelines as laid out in '*site requirements*'.

Replacement parts can be ordered from Triton Customer Service. See '*spare parts*' for details and part numbers.

MAIN COMPONENTS

Fig.1

Ref.	Description
1.	Mixer valve
2.	Face plate
3.	On/Off flow control knob
4.	Trim ring
5.	Trim ring seal
6.	Temperature control knob
7.	Trim ring
8.	Trim ring seal

SITE REQUIREMENTS

The installation **MUST** be in accordance with Water Regulations and Bylaws.

Running water pressure:

- Gravity fed – 0.1 bar min.
1.0 bar max.
- Mains fed – 1.0 bar min.
5.0 bar max.

Maximum static water pressure:

- Gravity and mains – 10 bar

DO NOT connect the mixer shower to a gravity hot supply and a mains cold supply (or vice versa).

For the best performance within the specified running pressure range a minimum flow of eight litres per minute should be available to both inlets.

While the mixer shower is operational (open outlet), inlet pressures **MUST NOT** be capable of exceeding 7 bar. For effective operation of the internal seals, the maximum static pressure must not be exceeded.

Note: On sites where the running pressure is above 5 bar, the use of a suitably sized pressure reducing valve fitted in the cold mains supply pipework can provide nominally equal pressures at the shower mixer.

The pipework should be installed such that the flow is not significantly affected by other taps and appliances being operated elsewhere on the premises.

Note: Where thermal store systems and instantaneous gas water heaters are used, if excessive draw-offs take place the boiler may not be able to maintain an adequate output temperature. This could result in the shower temperature becoming noticeably cooler.

Water temperature requirements

Maximum hot water temperature = 80°C

Recommended maximum = 65°C

Minimum hot water temperature = 52°C

Maximum cold water temperature = 20°C

BS 6700 recommends that the temperature of stored water should never exceed 65°C.

A stored water temperature of 60°C is considered sufficient to meet all normal requirements and will minimise the effects of scale in hard water areas.

Temperature adjustment range

The mixed water temperature can be adjusted from cold through to a top limit which must be pre-set during installation with full anti-scald protection throughout the range (35°C to 40°C) providing the hot water temperature at the inlet remains 10°C above the outlet temperature.

Should there be a loss of flow to either incoming supply then water from the shower will stop or be reduced to a trickle until both supplies are restored.

Fig.2 (diagrammatic view – not to scale)

Fig.3 (diagrammatic view – not to scale)

TYPICAL SUITABLE INSTALLATIONS

a) Instantaneous gas-heated systems, e.g. combination boilers (fig.2)

The shower control MUST be installed with a multipoint gas water heater or combination boiler of a fully modulating design (i.e. to maintain relatively stable hot water temperatures).

A drop tight pressure reducing valve MUST be fitted if the supply pressures exceed 5 bar running.

An expansion vessel (shown in **fig.2**) MUST be fitted, and regularly maintained, to make sure the shower mixer is not damaged by excess pressures. This may already be installed within the boiler (*check with manufacturer*) and is in addition to the normally larger central heating expansion vessel.

The layout and sizing of pipework MUST be such that nominally equal inlet supply pressures are achieved and the effects of other draw-offs are minimised. The hot supply temperature MUST remain a minimum of 10°C hotter than the required blend temperature for best performance.

b) Unvented mains pressure systems (fig.3)

The shower control can be installed with an unvented, stored hot water cylinder.

For systems with no cold water take off after the appliance reducing valve, it will be necessary to fit an additional drop tight pressure reducing valve when the mains pressure is over 5 bar. The drop tight pressure reducing valve must be set at the same value as the unvented package pressure reducing valve.

Note: An additional expansion vessel (**fig.3**) may be required if a second pressure reducing valve is installed. This does not apply to packages with a cold take off after the pressure reducing valve to the cylinder.

The layout and sizing of pipework MUST be such that nominally equal inlet supply pressures are achieved and the effects of other draw-offs are minimised.

c) Mains pressurised thermal store systems (fig.4)

Packages of this type, fitted with a tempering valve (blender valve) can be used. A drop tight pressure reducing valve **MUST** be fitted if the supply pressures exceed 5 bar running.

An expansion vessel (shown in **fig.4**) **MUST** be fitted, and regularly maintained, to make sure the unit is not damaged by excess pressures. This may already be installed externally or internally within the thermal store (check with thermal store manufacturer).

d) Gravity fed systems (fig.5)

The shower control **MUST** be fed from a cold water cistern and hot water cylinder providing nominally equal pressures. There must be a minimum of one metre head of water. The minimum head distance is measured from the base of the cold water cistern to top of the showerhead.

e) Pump assisted gravity systems (fig.6)

The pump must be fed from a cold water cistern and hot water cylinder providing nominally equal pressures and be capable of maintaining a minimum running pressure of one bar.

Refer to the pump installation guide to establish the minimum head requirements for automatic operation of the pump.

Fig.6 (diagrammatic view – not to scale)

INSTANTANEOUS WATER HEATERS APPLIANCE CAPABILITIES

For best performance from the shower when connected to an instantaneous water heater, the appliance must be capable of raising the temperature of the incoming water to a minimum of 52°C (125°F) and delivering a flow rate of not less than eight litres per minute.

Should simultaneous demands on the water heater affect the water temperature then it is advisable to fit flow regulators into the mixer valve inlet pipework.

Note: The flow regulators are NOT supplied.

With flow regulators fitted and the system is in use, the On/Off flow control should be turned fully anti-clockwise to full flow setting.

PREPARING THE MIXER VALVE

WARNING!

The shower must not be positioned where it will subject to freezing conditions.

Check the contents to make sure all parts are present.

Before installing, make sure all the openings on the valve are carefully covered to stop ingress of any debris etc.

The shower valve is suitable for installation in a chased out cavity in a solid wall, a stud partition wall, a dry lined wall or for fixing to a shower cubicle or panel.

The hot and cold water pipes should not be permanently attached to the wall within one metre of the valve prior to installation to allow for final adjustment of the valve position.

SITING OF THE SHOWER

Note: Suitable service valves (complying with Water Regulations and Bylaws) MUST be fitted on the hot and cold water supplies to the shower as an independent means of isolating the water supplies should any maintenance or servicing be necessary.

Refer to **fig.7** for correct siting of the shower.

Position the shower and showerhead on the wall so that all controls can be comfortably reached whilst using the shower.

The unit must be positioned vertically with the outlet port at the top (marked with an 'arrow' on the brass body).

IMPORTANT: The hot entry port is stamped 'H' on the mixer body.

Fig.7 (diagrammatic view – not to scale)

INSTALLATION

a) General conditions

Note: The outlet of the shower MUST NOT be connected to anything other than the showerhead supplied.

DO NOT use jointing compounds on any pipe fittings for the installation.

Suitable ½" BSP to 22 mm or 15 mm compression fittings (not supplied) MUST be used for connecting to the water supplies.

DO NOT solder fittings near the mixer unit as heat can transfer along pipework and damage the seals and thermostatic components.

When connecting the pipework, avoid using tight 90° elbows. Swept or formed bends will provide the best performance.

The hot water inlet is stamped 'H' and the cold water inlet is identified as 'C'.

½" BSP straight or elbow male thread couplers must be fitted to the inlet ports for either rising, rear or falling hot and cold water supplies.

A ½" BSP straight coupler needs to be fitted to the valve outlet.

Note: These couplers are NOT supplied.

Screw the couplers into the inlets and the outlet of the valve. THE COUPLERS MUST BE TIGHTENED AGAINST THE VALVE BODY. The fittings will require PTFE tape or other means of sealing.

Before starting the installation, make sure the available depth of the recess or cavity is between 65 – 80 mm as measured from the finished surface.

The allowance for varying thickness of tiles up to 10 mm is accommodated to a limited degree by the tolerance between the control knob and trim ring.

b) Installation in a solid wall

Decide on the shower position and whether the hot and cold water supplies will enter the shower from the top (falling), the bottom (rising), or the rear.

The building depth should be at least 65 mm deep from the finished wall surface.

As a guide for the size of hole, it should be large enough to accept the valve complete with the inlet and outlet fittings and also allow access for connection to the pipework (**fig.8**).

Remove the plaster and brickwork to the required depth and chase out any additional areas of the wall to allow the route of the pipework to and from the valve.

Note: The valve body requires a deeper recess (about 5 mm greater) than the inlet and outlet fittings.

Offer the valve body up to the wall and mark the two fixing holes. Remove the valve and drill and plug the wall. Route the pipework to valve body position.

Flush out the pipework in accordance with Water Regulations and Bylaws.

Offer the valve up to the pipework and secure with screws through the two fixing brackets on the valve body.

Go to the 'connecting supply pipes' section.

c) Installation in a hollow wall

Decide on the shower position and whether the hot and cold water supplies will enter the shower from the top (falling), the bottom (rising), or the rear.

When installing into a stud partition or other hollow wall structures, the installer will need to consider building rear supports or other options. Such options are beyond the scope of this guide.

The hollow cavity should be at least 65 mm deep from the surface of the wall.

Mark the route of the incoming and outgoing pipework.

Take out the plasterboard. Offer the valve body up to the fabrication and mark the two fixing holes. Remove the valve and drill the holes. Route the pipework to the valve position.

Flush out the pipework in accordance with Water Regulations and Bylaws.

Offer the valve up to the pipework and secure with screws through the two fixing brackets on the valve body.

Go to the 'connecting supply pipes' section.

d) Installation in a panel or cubicle

When installing into a panel or cubicle structure the installer will need to consider building supports or other options. Such options are beyond the scope of this guide.

There should be at least 65 mm space from the surface of the panel to the rear of the valve body.

IMPORTANT: Access to the rear of the valve must be available.

Decide on the shower position and whether the hot and cold water supplies will enter the shower from the top (falling), the bottom (rising), or the rear. Mark the route of the incoming and outgoing pipework.

The control knobs require two holes to be cut out of the panel or cubicle. Use the face plate as a template to mark the hole positions then extend further to allow access for the filters.

Route the pipework to valve position.

Flush out the pipework in accordance with Water Regulations and Bylaws.

Offer the valve up to the pipework and secure with screws through the two fixing brackets on the valve body.

CONNECTING SUPPLY PIPES

Connect the hot water supply to the inlet marked 'H' and connect the cold water supply to the inlet marked 'C'.

Tighten all compression fittings.

FITTING THE FIXED HEAD PIPEWORK

Complete the outlet pipework, ending in a $\frac{1}{2}$ " BSP x 15 mm female thread elbow (**fig.9**). Finish the wall so that it is flush with the fitting (**fig.10**).

Note: This fitting is not supplied as variations in installations require the selection of the most suitable fitting.

MAKING GOOD

Make good the wall, tiling, etc. around the fixed head outlet.

Plaster or tile around the unit. Leave enough room around the unit to allow access to the valves and filters. This will allow the valve unit to be serviced without the need to break any tiles.

Make sure the grout lines are flush with the tiles in order to provide a smooth sealing surface for the face plate.

FITTING THE FACE PLATE AND CONTROLS

Insert the rubber trim seals into the openings of the face plate (**fig.11**).

Fit the face plate over the valve controls and slide tight up to the wall. Make sure the rubber seals stay in place as they slide over the trim. A smear of liquid soap on the seal will ease this procedure.

IMPORTANT: Using a suitable sealant, seal around the face plate to stop water entering the wall.

Fitting the temperature control

Temporarily fit the temperature control knob onto the splined adaptor (**fig.12**).

Fitting the On/Off flow control

Fit the On/Off flow control knob onto the splined shank and tighten onto the spline with the screw supplied (**fig.13**). Fit the end cap in place.

COMMISSIONING

CHECK THAT ALL SUPPLY PIPEWORK HAS BEEN FLUSHED THROUGH BEFORE COMMISSIONING.

Make sure that both hot and cold water supplies are fully open and at (or near to) their design temperature and pressures and are within the requirements as stated.

Make sure the temperature control knob is rotated fully anti-clockwise (maximum temperature setting).

Start the water flow by turning the On/Off flow control anti-clockwise towards ON.

Allow the shower to run at the maximum temperature setting until the water temperature has stabilised. Rotate the temperature control knob until your desired maximum showering temperature is reached.

The mixer valve is factory set to provide a maximum outlet temperature of 38°C but this should be checked on site to make sure the setting has not been altered and also to guarantee user safety.

Fig.11

Fig.12

Fig.13

WARNING!

Do not use abrasive cleaners and solvents or the surfaces may become damaged.

To adjust the maximum temperature override setting

Remove the temperature control trim to expose the retaining screw. Undo the screw and pull off the temperature control knob (**fig.14**).

Turn the flow control fully anti-clockwise. Once there is a steady flow running, adjust the temperature valve spindle until the temperature is about 38°C (**fig.15**). Turn clockwise for cold and anti-clockwise for warm.

When you are satisfied with the temperature setting turn the flow control off.

Refit the temperature control knob, checking that the temperature stop aligns with the reference line on the mixer temperature stop.

Secure in place using the screw and fit the end cap.

Fig. 14

Fig. 15

OPERATING THE SHOWER

To start the shower, turn the On/Off flow control fully anti-clockwise for maximum flow.

To stop the water flow, turn the On/Off flow control fully clockwise.

To adjust the water temperature, rotate the temperature control — clockwise for a cooler shower or anti-clockwise for a hotter shower.

Fig. 16

CLEANING THE FILTERS

Turn off the water supplies before proceeding.

To access to the filters carefully pull the face plate away from the wall.

Unscrew the filter cap (**fig.16**) on each inlet and remove the filter assembly. Wash the filter thoroughly under running water to remove all debris. Screw the unit back into each inlet, making sure the 'O' ring is in place.

Refit the face plate.

CLEANING

When the controls and face plate require cleaning, take care not to scratch them in the process. Wash away any surface dust before cleaning with soapy water.

SPARE PARTS

Ref. Description

Part No.

1. Control knobs <i>(including max temp stop)</i>	83308710
2. Face plate	86001340
3. Mechanical headworks	83311060
4. Thermostatic cartridge	83311070

FAULT FINDING

The following can be carried out by a competent person

Problem/Symptom	Cause	Action/Cure
1 Water too hot.	1.1 Temperature control incorrectly commissioned.	1.1.1 Refer to 'commissioning' section.
	1.2 Not enough cold water flowing through shower.	1.2.1 Turn temperature control clockwise.
	1.3 Increase in the ambient cold water temperature.	1.3.1 Turn temperature control clockwise.
	1.4 Cold water supply blocked.	1.4.1 Turn off shower and consult a competent plumber or contact Triton Customer Service.
	1.5 High volume of cold water drawn off elsewhere.	1.5.1 Reduce the simultaneous demand from the supply.
2 Water too cold.	2.1 Temperature control incorrectly commissioned.	2.1.1 Refer to 'commissioning' section.
	2.2 Not enough hot water flowing through shower.	2.2.1 Turn the temperature control anti-clockwise.
	2.3 Decrease in the ambient cold water temperature.	2.3.1 Turn the temperature control anti-clockwise.
	2.4 Insufficient hot water supplies from the heating system.	2.4.1 Make sure heating appliance is set to maximum or has sufficient stored hot water. 2.4.2 Make sure heating appliance is igniting by trying a hot water tap elsewhere.
	2.5 Hot water supply blocked or restricted.	2.5.1 Turn off the shower and consult a competent plumber or contact Triton Customer Service.
	2.6 Flow regulators not fitted (HP systems only).	2.6.1 Fit flow regulators in the inlet pipework; see 'instantaneous water heaters appliance capabilities'.
3 High water flow and/or poor performance on a mains fed system.	3.1 Flow regulators not fitted.	3.1.1 Fit flow regulators into the inlet pipework; see 'instantaneous water heaters appliance capabilities'.
4 Water does not flow or shower pattern collapses when another outlet is turned on.	4.1 Water supplies cut off.	4.1.1 Check water elsewhere in house and if necessary contact local water company.
	4.2 Shower unit blocked.	4.2.1 Inspect the inlet filters. Clean if necessary.
	4.3 Blockage in pipework.	4.3.1 Turn off the shower and consult a suitably competent plumber.

FAULT FINDING

Problem/Symptom	Cause	Action/Cure
	4.4 Showerhead blocked.	4.4.1 Clean the showerhead.
	4.5 System not capable of supplying multiple outlets at the same time.	4.5.1 Reduce the simultaneous demand. 4.5.2 Check stop/service valves are fully open. 4.5.3 Check if sufficient water pressure.

The following is recommended for a professional qualified installer only

5 Water too cold.	5.1 Running pressure in excess of maximum recommended.	5.1.1 Fit a pressure reducing valve.
6 Shower controls noisy while in use.	6.1 Running pressure in excess of maximum recommended.	6.1.1 Fit a pressure reducing valve.
7 Shower will not shut off.	7.1 Pipework not flushed before connecting the unit (flow control damaged).	7.1.1 Renew flow control.

Service Policy

In the event of a complaint occurring, the following procedure should be followed:

- 1 Telephone Customer Service on 0870 067 3333 (0845 762 6591 in Scotland and in Northern Ireland), having available the model number and power rating of the product, together with the date of purchase.
- 2 Triton Customer Service will be able to confirm whether the fault can be rectified by either the provision of a replacement part or a site visit from a qualified Triton service engineer.
- 3 If a service call is required the unit must be fully installed for the call to be booked and the date confirmed. In order to speed up your request, please have your postcode available when booking a service call.
- 4 It is essential that you or an appointed representative (who must be a person of 18 years of age or more) is present during the service engineer's visit and receipt of purchase is shown.
- 5 A charge will be made in the event of an aborted service call by you but not by us, or where a call under the terms of guarantee has been booked and the failure is not product related (i.e. scaling and furring, incorrect water pressure).
- 6 If the product is no longer covered by the guarantee, a charge will be made for the site visit and for any parts supplied.
- 7 Service charges are based on the account being settled when work is complete, the engineer will then request payment for the invoice. If this is not made to the service engineer or settled within ten working days, an administration charge will be added.

Replacement Parts Policy

Availability: It is the policy of Triton to maintain availability of parts for the current range of products for supply after the guarantee has expired. Stocks of spare parts will be maintained for the duration of the product's manufacture and for a period of five years thereafter.

In the event of a spare part not being available a substitute part will be supplied.

Payment: The following payment methods can be used to obtain spare parts:

- 1 By post, pre-payment of pro forma invoice by cheque or money order.
- 2 By telephone, quoting credit card (MasterCard or Visa) details.
- 3 By website order, www.tritonshowers.co.uk

TRITON STANDARD GUARANTEE

Triton guarantee this product against all mechanical defects arising from faulty workmanship or materials for a period of five years for domestic use only, from the date of purchase, provided that it has been installed by a competent person in full accordance with the fitting instructions.

Any part found to be defective during this guarantee period we undertake to repair or replace at our option without charge so long as it has been properly maintained and operated in accordance with the operating instructions, and has not been subject to misuse or damage.

This product must not be taken apart, modified or repaired except by a person authorised by Triton. This guarantee applies only to products installed within the United Kingdom and does not apply to products used commercially. This guarantee does not affect your statutory rights.

What is not covered:

- 1 Breakdown due to: *a*) use other than domestic use by you or your resident family; *b*) wilful act or neglect; *c*) any malfunction resulting from the incorrect use or quality of water or incorrect setting of controls; *d*) faulty installation.
- 2 Repair costs for damage caused by foreign objects or substances.
- 3 Total loss of the product due to non-availability of parts.
- 4 Compensation for loss of use of the product or consequential loss of any kind.
- 5 Call out charges where no fault has been found with the appliance.
- 6 The cost of repair or replacement of showerheads, hoses, riser rails and/or wall brackets or any other accessories installed at the same time.
- 7 The cost of routine maintenance, adjustments, overhaul modifications or loss or damage arising therefrom, including the cost of repairing damage, breakdown, malfunction caused by corrosion, furring, pipe scaling, limescale, system debris or frost.
